Ally and Bob are playing a game called "Stone Game".  
There are  $n$  stones in a pile. Ally and Bob take turns to take the first number  
of stones. In each turn, a player can remove either one stone  
or two stones. The player who takes the last stone wins.  
They decide to play the game with  $n$  stones. Ally starts the game.  
You are to write a program to determine who wins the game.  
After you win, you can play the game again.

**Input Format**

First line contains  $n$ , which is the number of stones (1 ≤  $n$  ≤ 1000).  
Second line contains the number of stones.

**Output Format**

Print "Yes" in the case Ally wins, else print "No".

**Constraints**

1 ≤  $n$  ≤ 1000

1 ≤  $n$  ≤ 1000

You are displaying a game with  $n$  stones and number of stones.  
The game is played with  $n$  stones. The game is played with  $n$  stones.  
The game is played with  $n$  stones. The game is played with  $n$  stones.

The number of stones that each of the players from 1 to  $n$  have  
are equal to the number of stones that each of the players from 1 to  $n$  have.  
The number of stones that each of the players from 1 to  $n$  have.

1, 2, 3, 4, 5, and 6 stones.

1, 2, 3, 4, 5, and 6 stones.

1, 2, 3, 4, 5, and 6 stones.

Given a number, you should determine the sum of the number  
of stones for all of its digits. For example, the number 1234 has  
10 stones.

Complete the program. It must read an integer and return  
the sum of its digits.

**Constraints**

1 ≤  $n$  ≤ 1000

**Input Format** One integer  $n$ .

There is one line of text containing a single integer  $n$ , the  
number to be tested.

**Sample Input**

1234
